

Morning Dashboard

Setting it up on a computer

The morning dashboard is a single web page that everybody opens from the same SharePoint folder. There is **no server, no login and nothing to install** – which is why it will keep working with nobody looking after it.

If you only read one thing

You never create a folder. The folder already exists on SharePoint. On each computer you press **Sync** once, and Windows makes the local copy itself. Everything else in here is detail around that one act.

How it works

Two minutes of reading that will save whoever inherits this an afternoon.

There is one folder, on SharePoint. Inside it are the dashboard itself and one small file per day – `2026-08-25.json` and so on – holding that morning's numbers and comments.

Every computer keeps a **mirror** of that folder, made by OneDrive. When somebody presses Save, the dashboard writes into the mirror on their PC and OneDrive carries it to everybody else's within a minute. Nobody has to take turns, and two people typing different things never overwrite each other – the page reads the shared file back before it writes and puts in only what actually changed on that screen.

The three rules everything else follows from

1 Everybody points at the same folder

If half the plant is on SharePoint and half is somewhere else, the morning quietly splits in two and each half thinks the other stopped writing. One folder, no exceptions.

2 Everybody opens the dashboard from that folder

Not a copy in Downloads, not one from an email. An old copy does not know about boxes added since, and saves them back empty over everybody else's. The page checks for this now and shows a red bar, but the cure is simply never to keep a private copy.

3 Nothing is ever only in one place

What you type is kept on your own PC as well as in the folder. If the network drops or the folder is unreachable, the dashboard says so plainly and keeps your morning locally until it can share it. It will not pretend a failed save worked.

What is already set up

Both of these were done once and do not need doing again. They are here so the next person knows where things live.

SharePoint → **MaxSolutions-Mississauga** → Documents → **Daily Morning Dashboard**

- `Morning_Dashboard.html` lives in that folder — this is the dashboard.
- Everyone who types into the morning has **Edit** on the library. Read-only is enough to watch and not enough to save.

Setting up a computer

Nine steps, about two minutes, once per computer and never again. Do them in order – the folder has to exist on the machine before the dashboard can be pointed at it.

1 Open the SharePoint folder in the browser and sign in

Edge or Chrome. Sign in with the work account that person actually uses – whichever account is signed in here is the one whose permissions decide if they can save.

IT MUST BE A COMPANY ACCOUNT

A personal outlook.com, gmail or hotmail address will never work, no matter what is shared with it. Microsoft will say "does not exist in tenant 'Max Solutions, Inc'". That is not a permission you can grant – the account has to live inside the company directory.

2 Go into the Daily Morning Dashboard folder

Double-click into it so you can see the files inside. This matters more than it looks: pressing Sync at the top of the library copies down *everything* in Documents. Pressing it from inside this folder copies down only this folder.

3 Click **Sync** in the toolbar

It sits along the top of the file list. If it is not visible it is under the **...** menu. Windows will ask to open the OneDrive app – say yes, and sign in again if asked.

Figure 1. The toolbar across the top of the file list. Make sure you are inside *Daily Morning Dashboard* before you press it.

PICK ONE, NOT BOTH

There is also an **Add shortcut to OneDrive** button. It does a similar job but puts the folder somewhere different. If some people use one and some the other, you get two paths on the same PC and people point the dashboard at the wrong one. Use **Sync** everywhere.

4 Wait for the tick

The OneDrive cloud in the bottom-right of the screen spins while it copies, then settles. On a folder this small it takes seconds.

Figure 2. The OneDrive icon in the Windows system tray.

5 Find the folder in File Explorer

It appears in the left-hand sidebar under the **company name**, with a building icon. That is not the same as the blue personal OneDrive cloud above it – a lot of people click the wrong one.

Figure 3. The building icon is the company. The blue cloud is that person's private OneDrive and has nothing to do with the morning.

```
C:\Users\yourname\Max Solutions, Inc\MaxSolutions-Mississauga - Documents\Daily Morning Dashboard
```

6 Right-click the folder → Always keep on this device

Do not skip this one. Left alone, OneDrive saves space by keeping files in the cloud and only fetching them when opened. The dashboard reading one of those can come back empty – which looks exactly like somebody's morning having been wiped, and sends people hunting for a fault that is not there.

THIS IS THE STEP PEOPLE SKIP

If boxes are ever mysteriously blank on one PC and full on another, **this is the first thing to check.**

7 Open `Morning_Dashboard.html` from that folder

Double-click it where it now sits on the PC. Not a copy anywhere else. It is worth right-clicking it once and sending a shortcut to the desktop, so nobody is tempted to keep their own copy.

8 Press **Choose folder** and pick that same folder

It is the first button at the top of the dashboard. On a computer that has not been set up yet there is also a red bar across the page saying the same thing.

Figure 4. What a computer looks like before step 8. The bar disappears for good once the folder is chosen.

9 Chrome asks what it may do – answer **Edit files**

This is the single most important click in this document.

Figure 5. “View files” looks like the careful answer and it is the wrong one — the dashboard will read the morning perfectly and silently refuse to save it. That is what was wrong with the boardroom PC for months.

The red bar goes. That computer is finished. Chrome asks once more after a restart, which is one click, not the whole setup again.

The boardroom PC

The machine on the wall in the morning meeting. Same nine steps, two differences.

1 It needs a company account signed in

The boardroom PC is not on the company domain, so nobody's account is on it by default. That does **not** mean it cannot be done — syncing a SharePoint folder has nothing to do with domain membership. It only needs somebody to sign into OneDrive on it once, with a Max Solutions account that can see the library.

Use a **shared** account, not a person's. A wall PC signed in as somebody who has left the company is a problem waiting to happen.

WHAT TO SEND IT IF THAT ACCOUNT IS EVER NEEDED AGAIN

Can you create a Max Solutions account for the Mississauga boardroom PC — something like boardroom@maxsolutionsinc.com — with read access to the MaxSolutions-Mississauga SharePoint site? It is for a wall display in the morning meeting. It only ever reads one folder and never writes. It needs a licence that includes SharePoint, and it must be a shared account rather than a person's, because it stays signed in on that machine.

2 At step 9, answer **View files** instead

If the boardroom screen only ever *shows* the morning, give it read access and nothing more. A machine that cannot write cannot damage anybody's morning, and it will never fail in front of the room trying.

If people do type into the dashboard from the boardroom during the meeting, answer **Edit files** like any other PC, and that account needs Edit on the library.

Every morning, on that machine

→ Open the dashboard and press **Present**

It goes full screen and shows the shared morning — reading the folder, writing nothing. It refreshes itself every fifteen seconds, so comments typed by people at their desks appear on the wall during the meeting without anybody touching the boardroom keyboard.

Using it, and fixing it

What the buttons do, and what each thing that can go wrong actually means.

Figure 6. The top of the dashboard once a computer is set up. The folder icon on the left turns amber and grows a label if the folder is ever lost.

The buttons that matter

BUTTON	WHAT IT DOES
Edit	Turns the boxes on so the morning can be typed into.
Save	Reads the shared morning, merges what you changed into it, and writes it back. It will tell you if it could not, and it never pretends.
Present	Full screen, read-only. What the boardroom uses.
Choose folder	Points this PC at the shared folder. Used once, and again only if Chrome forgets.
Check this PC	Says what this computer looks like — its clock, its folder, whether the screen matches the shared file. Start here when one machine behaves differently from the rest.

When something looks wrong

WHAT YOU SEE	WHAT IT IS, AND WHAT TO DO
Red bar: <i>no shared folder picked on this PC</i>	Steps 8 and 9 have not been done here, or Chrome dropped the permission after a restart. Press Choose folder .
Red bar: <i>this is an old copy of the dashboard</i>	Somebody is running a newer version. Close the tab and open the copy in the SharePoint folder. Saving from an old copy blanks out boxes it does not know about.

WHAT YOU SEE	WHAT IT IS, AND WHAT TO DO
<i>NOT shared – saved on this PC only</i>	The write was refused. Almost always View files was chosen at step 9, or the account has read-only on the library. Nothing is lost; the morning is still on that PC.
Boxes empty that should not be	Always keep on this device was not set at step 6, so Windows is handing over placeholders instead of files. Set it and reopen the dashboard.
One PC shows a different day from everyone else	That computer's clock is wrong, so it is reading and writing a different day's file. Press Check this PC – it says so outright.
Files like <code>2026-08-25-SOMEPC.json</code> in the folder	Two people saved inside the same sync minute and OneDrive kept both copies. The dashboard finds these and folds them back in by itself. Nothing to do.
Files like <code>dashboard-2026-08-25.json</code>	Somebody's personal export saved into the shared folder by mistake. Nobody reads those. The morning everybody sees is the file named just <code>2026-08-25.json</code> .
Somebody's comment went missing	Press Check this PC on the machine that lost it. Failing that, SharePoint keeps a version history on every one of these files – right-click the day's file on the SharePoint site and choose Version history .

Figure 7. A healthy computer: the screen matches the file and the folder accepts writes. **Check this PC** changes nothing, so it is safe to run mid-meeting — and it is the fastest way to tell whether the fault is this machine or the file everybody shares.

If the dashboard itself ever needs replacing

It is one file. Put the new `Morning_Dashboard.html` into the SharePoint folder, replacing the old one, and everybody has it the next time they open it. Nothing to install, nothing to roll out, no PC to visit.
